Heli Modified Handlebar Relocation Clamp—\$329

The Tour Performance Handlebar Relocation Triple (HRT) clamp by Heli Modified is CNC machined from a solid block of 6061 T6 aluminum and repositions the handgrips and controls 1 1/2" closer to the rider for improved long distance riding comfort. They are also 1 1/4" thick and use two 8mm pinch bolts to anchor the triple clamp to the fork tubes, as opposed to a single bolt on the stock mount. Not only does this double the clamping strength of the fork tubes, significantly increasing rigidity, but it seems to reduce engine vibration transmitted through the handgrips too. The HRT clamp provides a more relaxed, upright riding position and alleviated some discomfort I felt in my back and

shoulders during multiple 700–1000 mile days.
